

# Create a safer, healthier workplace with no-contact fever detection

Connect Envoy with one of our preferred temperature scanning partners to easily detect elevated temperatures before anyone enters your space.

## Make sure everyone who enters your space is healthy

Have employees and guests complete a health questionnaire to get approved to come into work, then check their temperature when they arrive as an extra measure of protection.

## Prevent the spread of germs

With contactless thermal imaging technology, you can eliminate the need for physical contact or personal protective equipment (PPE) that would be required with standard thermometers.

## Alert your team if someone poses a risk

Automatically deny entry and alert admins if someone has an elevated temperature. Layer in extra security by connecting your access control system, so only healthy employees can badge into your workplace.

## How does it work?

**Step 1.** Position your temperature scanning hardware near your front desk or wherever employees and visitors will enter your space. Make sure you follow the system's set up instructions carefully to get the most accurate temperature reading.

**Step 2.** Have your team sign-in visitors from the Envoy dashboard when they arrive so they don't need to touch anything.

**Step 3.** When it's time to come to the office, employees can easily pull up the Envoy Mobile app and visitors can scan a QR code on the iPad at your front desk for easy, touchless sign-in.

**Step 4.** Make sure they are healthy before they enter your space by automatically scanning their temperature as they sign-in.

**Step 5.** Connect your access control provider with Envoy to automatically grant building access to anyone with a normal temperature, or deny access to anyone with an elevated temperature to keep your team safe.
